

Environmental Management

Environmental Management System Overview

Our corporate policy and activity goals are determined by the activity promotion organization (see the figure below) and then expanded to each individual site. Based on this, each site establishes its own policy and goals to pursue its environmental conservation activities. The status of the implementation is

checked in internal environmental audits conducted by the site itself, and in head office audits to grasp the achievements of the sites' activities, and make revisions.

Based on this, the Environmental Conservation Activity Program "Oki Eco Plan 21" for the next fiscal year is drafted.

Acquisition of ISO14001 Certification

To build Environmental Management Systems at the sites, Oki promotes the acquisition of ISO14001 certification. In fiscal 2003, one Japanese group company involved in distribution and one involved in maintenance and services, as well as two overseas group companies involved in manufacturing in China and Thailand acquired certification. This means that all overseas production plants are now certified. As of March 31, 2004, six sites of Oki Electric, 15 group companies in Japan and six overseas group companies have acquired certification. For the future, we will aim acquire integrated certification, building a "network-type environmental management system" that centralizes business processes in the entire Oki group.
